

APPARATUS FOR CONTROLLING A LUBRICATION FLUID LEVEL

Abstract

System and a method for automatically topping up an internal combustion engine (4) with lubricant. A lubricant container that includes a (1), a pipe (2) which connects the container to the internal combustion engine (4), a level pipe (5) which defines the oil level in a sump (6) and an apparatus (3) for transferring lubricant. The apparatus (3) for transferring lubricant makes it possible to transfer lubricant both from the container (1) to the internal combustion engine (4) and from the internal combustion engine (4) to the container (1).
